FASHION ADVISORY FOR BRANDS

Strategy, economics and transformation for fashion businesses

I help fashion-brand owners choose a market, a buying volume and a capital figure while the decision can still be changed: before the supplier order, before unsold stock, before the money is spent.

Growth • transformation • stabilisation

From market to cash

Choose a stage to open the area of work that covers it.

Market | Customer | Brand | Collection | Product | Buying and production | Inventory | Channel and sales | Cash

Areas of work

Money is made or lost where functions meet. Market, customer, product, operations and capital have to be planned together.

01

Strategic choice

Choosing markets in Russia, the CIS and Asia, and how to rebuild categories, product and commercial model for them.

DECISION

The choice of market, the scale of expansion and the size of the capital.

02

Commercial model

From customer and price to channel: retail, e-commerce, wholesale, marketplaces and marketing.

DECISION

Profit by customer and channel, not revenue on average.

03

Product and merchandise planning

The whole path of a product: collection and SKU, demand forecast, open-to-buy, allocation, replenishment, markdown.

DECISION

A call on each category: buy, produce, reprice or develop.

04

Operations, management and systems

How processes, roles and KPIs are set up, which systems are needed (PLM, ERP, CRM, WMS, BI) and how production, warehouse and logistics connect.

DECISION

One management rhythm and one set of numbers across every department.

05

Capital, investment and resilience

Cash flow and working capital, valuation, a calculated funding need, transactions and stabilisation.

DECISION

The size of the capital, the case for it, and whether the business is ready to grow or to do a deal.

What owners come with

The requests vary, but each ends in an action: where to grow, what to stop, what to stabilise, what to fund.

GROWTH

New market

DECISION

Choose the priority market, entry model, assortment and pricing.

GROWTH

Category expansion

DECISION

Work out where the brand can credibly expand.

GROWTH

Investment choice

DECISION

Decide what to scale first.

GROWTH

Growth constraints

DECISION

Remove bottlenecks before expansion.

COMMERCIAL

Sales grow, margin does not

DECISION

Find where the margin leaks.

COMMERCIAL

Channels generate revenue

DECISION

Measure contribution and reset terms.

COMMERCIAL

Customer acquisition cost is rising

DECISION

Rework pricing, marketing and repeat sales.

COMMERCIAL

Markdowns erode margin

DECISION

Redesign discounts, inventory and exit rules.

PRODUCT AND OPERATIONS

The assortment keeps growing

DECISION

Decide what to develop, cut or reprice.

PRODUCT AND OPERATIONS

Inventory is unmanaged

DECISION

Set allocation, replenishment and transfers.

PRODUCT AND OPERATIONS

Production slows growth

DECISION

Adjust capacity, lead times, quality and suppliers.

PRODUCT AND OPERATIONS

Product development and data are disconnected

DECISION

Design the PLM, BI and automation set-up.

CAPITAL AND MANAGEMENT

Profit does not convert into cash

DECISION

Connect profit, cash and working capital.

CAPITAL AND MANAGEMENT

Capital need or transaction

DECISION

Prepare the model, the funding need and the materials.

CAPITAL AND MANAGEMENT

Decisions are made too late

DECISION

Introduce early-warning indicators, a management cycle and controls.

CAPITAL AND MANAGEMENT

Roles and decision rights are blurred

DECISION

Define accountability and decision rights.

The test of success: the mistake is caught in the calculation, not in dead stock, a cash gap, a lost season or a bad investment.

How data becomes a decision

Four steps from hand-collected numbers to a decision.

01

Sources

Sales, inventory, customers, buying, production, finance, marketing.

02

One data model

Reference data, calculation rules, data quality, ownership.

03

Decision dashboard

Margin, cash, product, customer, channel, capacity, deviations.

04

Action

Buy, stop, reprice, transfer, invest, stabilise.

Data, analytics and PLM

Six areas of data work: from the style record to a buying signal.

PLM for product development

Style record, materials, samples, specifications, cost, versions, approvals and the collection calendar.

Analytics and BI

One version of sales, margin, inventory, customers, channels, buying, production and cash.

Systems architecture

Requirements for ERP, CRM, WMS and integrations: what each system does.

AI and automation

Demand forecast, stock signals, markdown scenarios, buying and allocation recommendations.

Merchandise planning

Forecast, open-to-buy, size curves, allocation, replenishment, transfers and product availability.

Implementation control

Requirements, process testing, training and the move from spreadsheets to routine management.

What you are left with is set out in the “Data, analytics and PLM” format. Principle: business logic, data and accountability first; systems and automation second.

What stays inside the company

Models, rules, metrics, roles and regular control stay in the company.

Owner decisions

- Where to invest and which new market to enter
- What to buy, produce, mark down and scale
- Which channel, customer and category make a real contribution
- How much capital growth, a deal or stabilisation requires

Working tools

- Profit economics and cash requirements
- Market, competitor and growth geography map
- Assortment, buying and inventory model
- Target digital architecture and PLM / BI requirements

Stabilisation mode

- Planning: cash, constraints, priorities
- Organisation: processes, roles, accountability
- Leadership: team, decisions, negotiations
- Control: a short plan → actual → action cycle

Where needed, my role grows from adviser to the owner to head of the stabilisation programme: these are the “Owner’s adviser” and “Programme lead” formats.

Relevant experience

Type of problem, scale and depth of work, with no client names.

MANAGEMENT EXPERIENCE

Large multi-brand fashion retail

500+ brands, 30,000+ SKUs: buying, assortment, margin, stock turn, merchandise analytics and decision automation.

OPERATIONAL DIAGNOSTICS

Premium segment: development and production

Finance → product → production → inventory → management. From order economics and capital to production and the management model.

STRATEGY AND FINANCE

Growth strategy, markets and capital

Market → financial model → capital → negotiations. Geography, competitors, funding needs and materials for the owner’s decision.

STABILISATION

Rebuilding management in volatile conditions

Liquidity → priorities → accountability → control. Restoring control and returning the business to growth.

Abbreviations

PLM	product lifecycle management
ERP	enterprise resource planning
CRM	customer relationship management
WMS	warehouse management system
BI	business intelligence: dashboards and reporting
SKU	stock-keeping unit
