

Strategy, economics and transformation of fashion businesses

Growth • transformation • stabilization

We help owners understand the economics of a decision before it becomes a purchase order, inventory, obligation or committed capital.

We work at the intersection of strategy, commercial agenda, product, data, data, digital architecture, finance and management execution.

End-to-end working logic

Economic performance is created at the intersection of functions

We connect market, customer, product, operations, capital and digital architecture into one decision system.

01	Strategic choices Russia, CIS and selected Asian markets; positioning; categories; product and commercial model adaptation.	DECISION Where to enter, what to scale and how much capital is required.
02	Commercial model Customers, pricing, marketing, retail, e-commerce, wholesale and marketplaces.	DECISION Where the brand really earns money by customer and channel.
03	Product and merchandise planning Collection, SKU, demand forecast, buying, allocation, replenishment and markdowns.	DECISION What to buy, produce, reprice and develop.
04	Operations, management and digital architecture Processes, roles, KPIs; PLM, ERP, CRM, WMS, BI; production, warehouse and logistics.	DECISION How to manage regularly, faster and on one version of data.
05	Capital, investment and resilience Cash flow, working capital, business valuation, financing need, transactions and stabilization.	DECISION How much capital is required, how to substantiate it and whether the business is ready for growth or a or a transaction.

Owners come for decisions, not reports

High-stakes brand challenges are translated into concrete management actions: where to grow, what to stop, what to stabilize and what to fund. what to fund.

GROWTH	COMMERCIAL	PRODUCT & OPERATIONS	CAPITAL & MANAGEMENT
01 New market Decision: choose priority market, entry model, assortment and pricing	01 Sales grow, margin does not Decision: identify where sales economics is diluted	01 Assortment is expanding Decision: decide what to develop, cut or reprice	01 Profit does not convert into cash Decision: connect P&L, cash and working capital
02 Category expansion Decision: define where the brand has the right to expand	02 Channels generate revenue Decision: measure contribution and reset terms	02 Inventory is unmanaged Decision: set allocation, replenishment and transfers	02 Capital need or transaction Decision: prepare model, funding need and materials
03 Investment choice Decision: decide what to scale first	03 Customer acquisition costs rise Decision: adjust pricing, marketing and repeat purchase	03 Production slows growth Decision: adjust capacity, lead times, quality and suppliers	03 Decisions are made too late Decision: install signals, management cycle and execution control
04 Growth constraints Decision: remove bottlenecks before expansion	04 Markdowns erode margin Decision: redesign discounts, inventory and exit rules	04 Product development and data are disconnected Decision: design PLM/BI architecture and automation	04 Roles and authorities are blurred Decision: define accountability and decision rights

Focus: make the decision before the mistake becomes inventory, a cash gap, a lost season or a wrong investment.

Data, analytics and PLM connect product, sales, inventory and cash into one decision system decision system

We do not design “one more system”; we build end-to-end management logic: product → sales → inventory → cash → decision.

PLM product architecture item card, materials, samples, specifications, costing, versions, approvals, collection calendar	Analytics & BI one version of sales, margin, inventory, customers, channels, buying, production and cash	Systems architecture requirements for ERP, CRM, WMS, integrations and the role of each system
AI & automation demand forecasting, inventory signals, markdown scenarios, buying and allocation recommendations	Merchandise planning forecast, buying budget, size curves, allocation, replenishment, transfers and product availability	Implementation control business requirements, process testing, training, moving from Excel to regular management

Position: business logic, data and accountability first; system selection and automation second.

The result stays inside the business — in decisions, tools and management rhythm

Outputs should live inside models, decision rules, KPIs, roles and regular execution control.

01 Owner decisions

- where to invest and which markets to enter
- what to buy, produce, markdown and scale
- which channel, customer and category creates contribution
- how much capital is required for growth, transaction transaction or stabilization

02 Working tools

- profit economics and cash need logic
- market, competitor and growth geography map
- assortment, buying and inventory model
- target digital architecture and PLM / BI requirements requirements

03 Stabilization rhythm

- planning: cash, constraints, priorities
- organization: processes, roles, accountability
- leadership: team, decisions, negotiations
- control: short cycle plan → actual → action

The role can extend from owner advisor to stabilization program lead lead

Priorities, cross-functional coordination, execution control and difficult negotiations — to move from conflicting indicators to regular decisions: what to do, who owns it and when to review.

Relevant experience in fashion business

Client names and sensitive data are not disclosed. We show type of challenge, scale and depth of work.

01MANAGEMENT EXPERIENCE	02OPERATIONAL DIAGNOSTICS	03STRATEGY & FINANCE	04STABILIZATION
Large multibrand fashion retail	Premium segment product development and production	Growth strategy, markets and capital	Management reset in turbulence
500+ brands • 30,000+ SKUs	scope: finance → product → production → inventory → management	scope: market → financial model → capital → negotiations	scope: liquidity → priorities → accountability → control
buying, assortment, margin, turnover, merchandise analytics, decision automation	end-to-end work from order economics and capital to production and management model	geography, competitive landscape, financing need and materials for owner decisions	stabilizing control and returning the business to growth mode
